

Using Your Car Batteries To Power the Paranormal

By Eric Martin

We've all heard the talk of ghosts draining DC camera batteries when people are on an investigation. If the "ghosts" are really draining the batteries for energy, then what happens when you give them a really big battery?

I believe the future is going to reveal incredible ghost apparitions. Why? Because we are moving towards a future with electric cars that have incredibly large batteries. As we see more and more electric cars on the road we will also be hearing more fantastic accounts of the paranormal. In other words, if your future includes an electric car, make sure your future house is not haunted or you may never make it to work on time.

O.K., here is what you will need for this experiment:

- 1) One or Two car batteries that are either new or from your own vehicle in which case they are known to be working properly.
- 2) A battery charger with a Meter.

What you do:

1. Make sure the battery(s) are fully charged and note the charge level on the meter from your charger.
2. Place the battery(s) in a location where known paranormal phenomena occur. Note: Do not place the battery directly on the floor, especially if the floor is concrete. Place the battery on a milk crate, chair, or anything else just to get it up off the floor.
3. Setup your camera to film the area around the batteries. Start your camera and leave the building.
4. When you return later, the first thing you want to do is hook up your battery charger and check out the reading. If the battery is dead, then you may have something on camera.
5. If nothing happens the first time, try again.

An even simpler test is to take your already working car battery out of your car and place it in a haunted location. Leave it there overnight. The next day, put the battery back into your car (make sure the connections and terminals are clean. Now try to start your car. If nothing happens when you turn the key, then you may have just generated evidence of a haunting. Car batteries should not lose energy over a period of a few hours. That is why your car starts when you go to work in the morning.

I have had incredible results using the car batteries. Learn more at my website www.GhostEngineers.com
