“Real Proof” That Ghosts Exist

What is “real proof”? In the simple sense it is something (video or scientific) that the major news networks would consider carrying. For example, a video so compelling that it appears on CNN. A video that is hard to criticize as being “a trick” or computer generated. A Ghost Hunter can spend an entire lifetime searching for ghosts and never see one. Why? Because they

are looking in the wrong places, or always conducting investigations with large groups of people.

As far as the popular ghost hunting programs on TV, none of them have produced anything that could be considered “real proof”? Why? Because they don't know what they are doing. When a reputed lead paranormal investigator on TV says that Orbs are made of

pure energy, it only shows that they have no understanding of physics. Energy cannot exist without matter. If you ask a Physicist to describe “Pure Energy” he will kick you in the ass and tell you to get out of his office. At least at my university that is what would happen.

You will know that Real Proof has finally been discovered when it is mentioned by the President.

85% of TV Ghost Hunters Have No College Degree

We did some investigating and determined that nearly 85% of all ghost hunters on TV do not have a college degree. We also determined that none of them have Physics, Engineering, or other type of Science degree. Basically, their only qualifications are that they can operate a camera, stumble around in the dark, and occasionally capture something obscure on camera or on audio that may or may not be something paranormal. We strongly believe that

the final “Great Discovery” of whether ghosts exist or not will come from someone with a deep knowledge of physics. Uncovering the secret behind ghosts boils down to a physics problem.

We are not knocking those investigators that do not have a college degree. What we are saying is that you should also grab a physics book and start reading. Study thermodynamics to understand what is happening when you encounter “cold spots”.

Read a book about space science to see all the things that Physicists currently “do not know.” The key may lie in one of those areas. Read any book about Neutrinos, the potential building block of ghosts.

Once you understand the physics, you can start to experiment in a truly haunted location (like Gettysburg or the Waverly Hills Sanatorium.) Lastly, you will have the greatest success if you conduct your investigations alone.

Investigation – Aztec Hotel, Los Angeles

Aztec Hotel

“When I asked how many nights the ghost hunters stayed at the hotel during their investigation the staff laughed and said they usually stay for about 30 minutes!”

Aztec Hotel - Monrovia, California outside Los Angeles - I've just learned that the history reported about this location is all mixed up. The hotel employees talk about a prostitute named "Razzle Dazzle" who died in room 120 while the most popular book on the hotel mentions room 129 and a resident named Jenny Lynn. I have no choice but to spend a night with the equipment in

both rooms and spend a night in each one. The Neutrino Detector takes several hours to set up.

Talking to the staff, I've also learned that many other "Ghost Hunters" have visited the Hotel. When I asked how many nights the ghost hunters stayed at the hotel during their investigation the staff laughed and said they usually stay for about 30 minutes! This is why so

many Ghost Hunting teams never find anything. If there is a haunted room in a hotel you need to spend at least one night in that room or it is really pointless.

I also listened to a recording someone put on YouTube of a supposed ghost at the hotel moaning. They have the radio playing at full volume and I cannot hear anything but the music.

Queen Anne's Palace – Arcadia, CA

The only way to investigate this place is at night because it is packed with people during the day. You will either have to ask the staff to let you stay for an investigation or you will have to hide inside the park after it closes. They have a security guard who drives around in a golf cart, but if he sees you just tell him you are looking for your cat. You could also just

run, golf carts are not very fast. Since I do not have a TV series they will probably not let me conduct an investigation. But I'm sure they would do it for that uneducated pair of plumbers called the "Ghost Hunters".

Speaking of Ghost Hunters, I visited this location during the day and took all kinds of photos of the castle using my sonar and digital

cameras. Several of them had "Orbs" in the photos, but I can tell you right now that they were all caused by reflections from the sun. But if I was one of the Ghost Hunters I would post it on the internet and call it a ghost.

I won't conduct an investigation at this location. I need to start working on the places that are Very haunted like the Queen Mary.

Equipment for the Queen Mary

Unfortunately, our Neutrino detector is too large to carry on the Queen Mary, but we will still use the Entity Caller, Entity Locator, and the Sonar Camera. Once again it would be best if I was alone, but initially I

will have to tag along behind a "tour group". Fortunately, several tour groups have reported paranormal activity. The secret is to remain at the back of the line. I also heard that the fake psychic with the white hair

and black mustache conducts the tours. If he is there, I will proceed to tear him to pieces and catch it on camera. For example, I will ask him why he freaks out when he hears a noise but supposedly can hear and talk to ghosts.

New Equipment

"Neutrino Detector" - this device detects large concentrations of "Neutrinos". Everyday discoveries about Neutrinos make them seem more and more like ghosts. Neutrinos, are elusive particles once believed to be without mass but may actually contain all the mass in universe. These invisible particles

can go through walls, have mass, and are very difficult to detect and see. We believe ghosts have mass since they can deflect laser beams and sound waves.

"Entity Locator" - using ultrasonic sound waves, whose frequency is beyond the range of human hearing, this device can measure the distance to

anything, including a ghost. If you are in the *center* of an *empty* room and the nearest wall is 10 feet away, but the locator is registering 9ft, 8ft, ...1ft, then this would indicate that you are being approached by something you cannot see but has the ability to deflect sound waves (perhaps a ghost?)

Eric loses TV series, but achieves "Expert Author" status

A lot of people have been reading Eric's articles about the paranormal on EZines. This shows that people are looking for answers in new places.

The bad news is that Eric was asked to join a

paranormal TV series as the technical lead. Unfortunately, during the demo taping, Eric criticized a particular television series because they did not understand the basics of a Tesla Coil and didn't realize that

EMF detectors are useless around a running coil. Eric found out later that the show he criticized was the one he was auditioning for. The show was Ghost Lab. Does Eric need to keep his mouth shut? Tell us what you think!

About Our Organization..

We are dedicated to breaking all the rules when it comes to "ghost hunting"! We are a group of ex-General Electric design Engineers that build devices and conduct

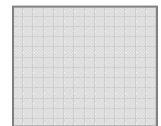

experiments never seen before in the paranormal arena. Right now, we have a list of over 100 devices and experiments that should bring us one step closer to understanding

what ghosts are made of. We are also pioneering new ways of powering ghosts to cause them to manifest. Ghost Hunting is one thing, a physics problem.
